M.O.M. Version 11 Release 4!

Realizing the Benefit of Customer-Driven Development

Your business needs a partner who understands your needs and who is dedicated to helping you succeed. Freestyle wants to help you reach your goals, and M.O.M. Version 11 has been built with *real customers'* input to better address *their* true, actual, critical needs. We've spent the past two years hard at work, listening to customers' feedback and building the latest version of M.O.M. to:

- **Optimize** workflows
- Make M.O.M. **Easier and More Convenient** to use
- **Enhance Critical Features** and processes
- Keep pace with the tools and PCI directives to keep your business **Secure**

Optimization

Improving the performance of M.O.M. and optimizing tasks that your business performs on a daily basis!

***Cartonization (Packing Virtualization)** – The new Packaging Virtualization allows merchants to see a virtual view of how each recommended box should be packed. The virtual view includes package details and status to confirm each box is shipped complete and packed properly. M.O.M. will provide visual cues and will print recommendations for which box(es) to use to optimize the fulfillment process. The entire fulfillment process will be streamlined and dramatically reduce your cost for boxes, dunnage material and shipping rates.

Enhanced Credit Card Batch Screen – Enhanced screen includes new filter displays and categories. This change streamlines and optimizes the batch process for users, who will now be able to easily reconcile expected transactions to be processed based on the filter display chosen.

Enhanced Magento 2 Product Publishing – A new option is available for product and inventory filters to use a strict filter which ignores last modified date. This new option allows merchants a quick and optimized way to update one or many products and inventory to a Magento 2 store.

Note – For items marked with an asterisk () see the [Advanced Order Processing Module Solution Sheet](#) for more detail.*

Ease of Use & Convenience

Making M.O.M. easier to use and enhancing the user experience.

Clear Ship Modify After Each Invoice Part – Introduces new option in global parameters to allow merchants to clear the ship modify flag after each invoice part. This is useful when handling backordered items that require additional shipping charges. When used, this option saves an extra step of removing the ship modify flag and ensures proper shipping charges are reflected on all subsequent order invoice parts.

Expanding Order Notes – Order Notes in the order entry screen can now be expanded for easier review.

Product Description Added in Auto Replenish Screen – Introduces the product description field in the auto replenish screen as another quick and easy way to identify the proper stock item to be replenished.

New Purchase Order Screen Now Includes Reference Field – Reference field is now available in the new purchase order screen to help identify specific purchase orders from vendors with multiple open POs with ease.

Dropship Return Enhancement – Dropship returns will now go back to original warehouse removing any confusion for a CSR handling dropship return orders.

Magento 2 Inventory Sync Enhancement – Introduces a new option to handle and manage inventory in Magento 2. Merchant will now have the choice of publishing units in stock vs net on shelf inventory. This provides flexibility to accurately track inventory between M.O.M. and Magento 2.

Enhancement of Existing Critical Features

Extending current functionality and allowing more flexibility in M.O.M.

Amazon Replacement Order – M.O.M. now supports the import of Amazon replacement orders. Imported replacement orders will be placed on review upon import along with order notes that will include the Amazon Order ID and M.O.M. Original Order. This allows merchants to review all replacements orders and easily find the original orders using the Amazon or M.O.M. ID as preferred.

Customizable UPS Additional Charges – Introduces feature to allow merchants to adjust their negotiated additional charges via discount percentage. This ensures accurate shipping charge for UPS orders.

Invoice Date Now Includes Time – Invoice date will now include a timestamp for easier and more accurate reference on when the ordered was invoiced.

Magento 2 Inventory Enhancement: Stock Status Update – M.O.M. inventory sync will now have an option to turn “Out of Stock” into “In Stock” when non-zero inventory is published, providing more control for our Magento 2 merchants.

Magento 2 Inventory Enhancement: Kit Inventory – New option to provide merchant the choice to send inventory for composite products based on component inventory that can be assembled.

Magento 2 Order Exception – Magento 2 Order Exceptions are now available to be reviewed in the order import exception screen. This provides merchants a quick glance to review and resolve any exceptions from Magento 2 imported orders.
